Subject: Bill 5288

To whom it may Concern:

I would hope to think that the state would have done a major study of short and long term effects of using this Magnesium Chloride Salt Mixture solution on steel bridges, concrete, and automobiles and trucks!!!

It would be a huge expense, inconvenience, to the State and tax payers if in ten years our bridges required to be rebuilt.

Just think about the possible danger to everyone that drives vehicle's on the highways everyday that could have brake line failures that cause major accidents and deaths that could be tied back to this material use!!

If a study wasn't done prior to using this solution for winter road treatment, I think it would be wise to use just the old salt and sand mix, until a proven additive can be added and tested to the new liquid method, to prevent its destructiveness.

My son had (two) premature brake line failures on his less than 10yr old Chevrolet 1/2T pickup....

Thanks for listening....Dan Greer, Bristol Ct
